

INSTALLATION INTRUCTIONS for **EQUALIZER MOTOR PLATE**

Rivera Primo's EQUALIZER MOTOR PLATE is designed to couple the motor and transmission together when using an open primary belt drive system. Manufactured in the USA from virgin aluminum, the Equalizer will outlast your motorcycle. It bolts directly to Rivera Primo's alternator cover (# 2014-0002) and bearing support (#PP-103).

When installing the plate as a unit with the alternator cover & bearing support it is recommended that threadlock be used with the appropriate bolts. If you're using studs and locknuts also use threadlock. Ensure that all components are correctly aligned before using threadlock.

An inch or more of adjustment is available for adjusting belt tension & and transmission alignment. Two thick washers are supplied to protect the slot indents. The two studs supplied with the kit are intended for use in the two holes in the left side of the transmission case. Remove the OEM studs and replace them with these. The idler is optional.
